WHO - FAMILY OF INTERNATIONAL CLASSIFICATIONS NETWORK ANNUAL MEETING 2014

Grouping Body Functions (BF) and Activity and Participation (AP) categories in children functioning assessment: a new core set or some ontologic suggestions?

11-17 October 2014 Barcelona, Spain

Abstract Results are shown on the contents of a web tool to facilitate the description of the individual functioning/disability balance in children. BF and AP categories were combined according to specific assessment criteria, taking into account the EF role.

Introduction

There are no automated tools to describe functioning and disability in children that take into account the need to collect information on impairments, limitations and restrictions, and consider explicitly the Environmental Factors (EF) role. Aim: to define a web tool to facilitate the description of the individual functioning/disability balance in children, which combines BF and AP categories according to specific assessment criteria, and takes into account the EF role.

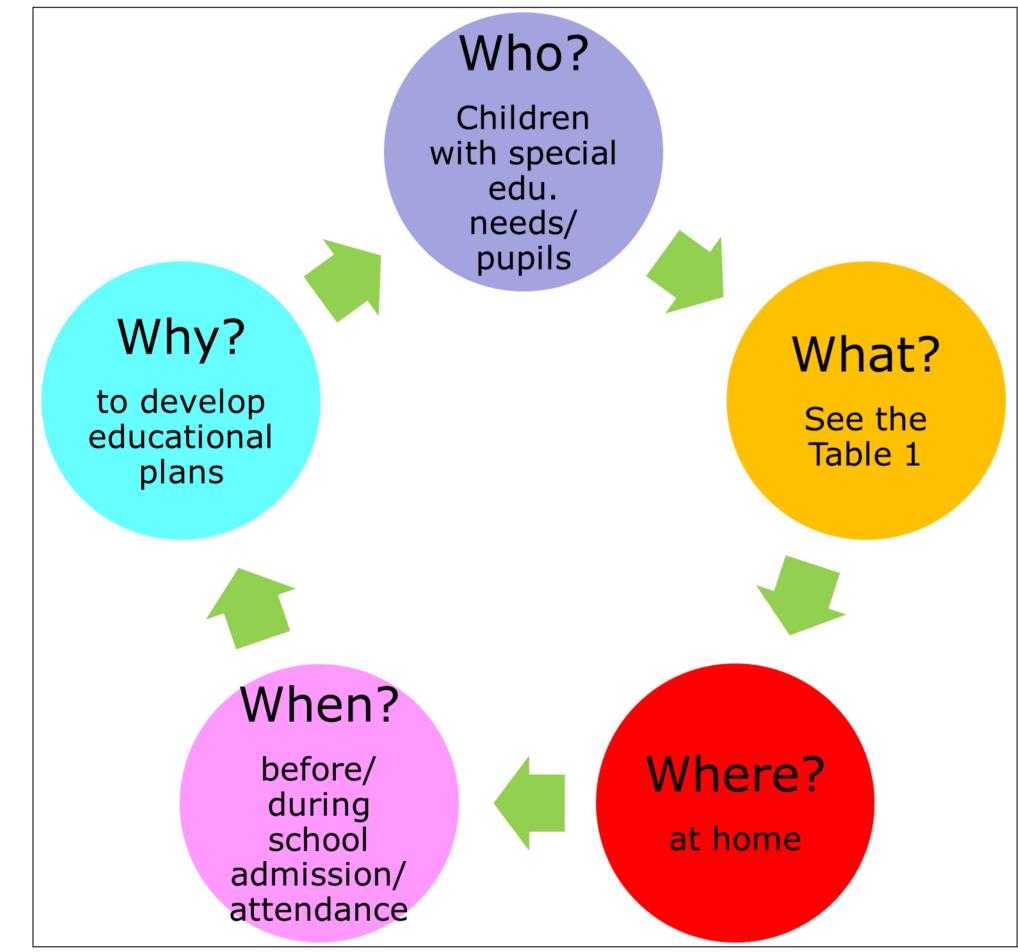

Figure 1 – The semantic STORM in children assessment

Methods & Materials

The starting points were the Italian administrative rules for school inclusion of children with disabilities and specific educational needs (1). These rules suggest to assess children in 9 areas: cognitive, relational, communication, linguistic, sensorial, movement, neuropsychological, social and personal autonomy, and learning.

Figure 1 – 5 W for exploring children functioning

Thirty professionals were selected among those who had taken part in the VilmaFABER field trial during 2013 and who had a specific background on neurological and psychiatric problems of children. Formal assessment documents prepared by the professionals were collected and information on functioning, written in natural language, was backcoded to ICF.

A list of BF and AP ICF categories was thus created, moving from a semantic storm (Figure 2). The professionals were then asked to group the information mapped to these categories into the 9 suggested assessment areas, avoiding to put a category in more than one assessment area.

The VilmaFABER system was updated with this new core set. An automated output was designed in order to release a specific valid document, written in both natural and ICF language. This new document describes the individual functioning/disability balance, according to the threshold between functioning and disability which VilmaFABER system was using (2). Field trials were planned to test the core set in selected samples in order to reduce the number of the chosen dimensions to assess and to verify how the information on the EF role for each category changes the meaning of the sentences written in natural language. The combination of BF and A&P categories describing 9 assessment areas may be helpful on the ICF ontological revision.
